## FOREWORD

This edition, the first under the title of *World Military Expenditures and Arms Trade*, is an expanded version of the annual publication *World Military Expenditures* which the Arms Control and Disarmament Agency previously published. In addition to including data on the arms trade, as the new title suggests, it updates information contained in that earlier publication—on military expenditures, gross national product (GNP), population, and armed forces—through 1973. In certain cases it also contains revisions in the data presented in earlier editions, where new and more accurate information has become available. Moreover, this new publication, for the first time, presents the data not only in terms of “current” dollars (i.e., expenditures as they appeared in each year, converted to dollars at going exchange rates), but also in terms of “constant” dollars—making allowance for the effects of inflation (using 1972 as the base year for prices and conversion rates).

The inclusion of such revisions and additional data has been facilitated by the use of a computer.

Earlier editions carried information on public health and public education expenditures. This new edition omits such information—partly because of the paucity of data, but also because the omission of *private* health and education expenditures led to distorted comparisons between free market and centrally planned economies.

Accurate information is essential for developing sound arms control arrangements. In the first instance, therefore, this is a working document for the use of government officials who are responsible for developing arms control proposals. Since arms control is quite literally “everybody’s business,” however, we hope that this publication will prove useful to many—in the academic community, in the press, and elsewhere—in focusing attention on the problems and possibilities of reducing global military expenditures and limiting worldwide arms transfers.

# WORLD MILITARY EXPENDITURES AND ARMS TRADE

## 1963-73

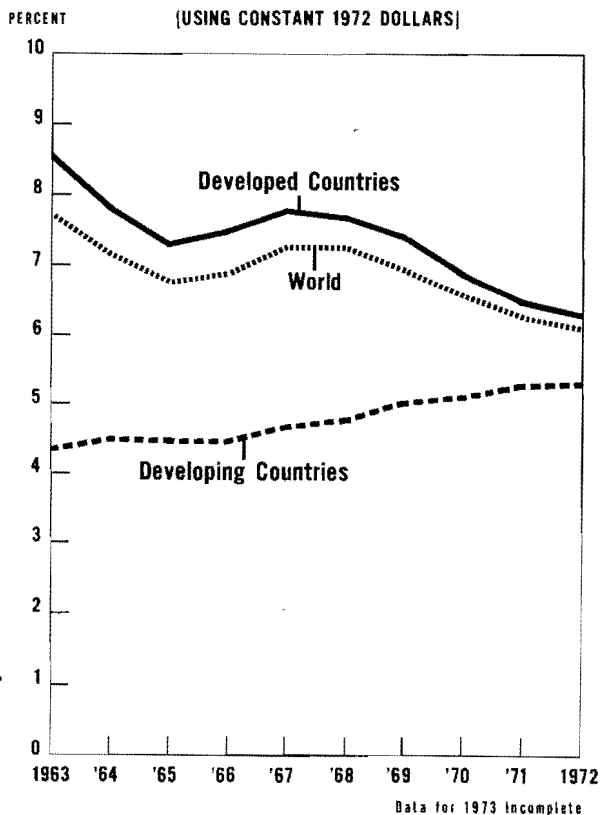

### Introduction

The data in this publication are estimations obtained from sources considered the best available at the time of compilation. Details on sources and methodology are contained in the Statistical Notes below.

In presenting this compilation, ACDA acknowledges that other persons or organizations drawing similar data from other sources (or from the same sources at different times) would undoubtedly arrive at figures different in detail from those presented in this publication. Moreover, some of the figures displayed in the tables in this booklet are extrapolations and estimates based upon incomplete time

Chart I

### TRENDS IN MILITARY EXPENDITURES AS PERCENT OF GNP 1963-1972

series from sources of nonuniform quality. It is unwarranted, therefore, to draw precise conclusions on such data, for they only sketch trends and suggest orders of magnitude.

Time series for military expenditures, gross national product (GNP), and arms trade for each country and group of countries are presented in current and in constant 1972 dollars.

The commonly accepted method of computing current dollar series by means of annual official exchange rates was used because of the desirability of expressing each country's annual military expenditures in actual current dollar purchasing power.

However, severe fluctuations in exchange rates during the past 3 years make recent years' current dollar figures especially inappropriate for purposes of country comparisons and, in many cases, for purposes of monitoring trends within a country.

By using the constant series, ambiguities and illogical comparisons are to some extent minimized. The constant 1972 dollar series are developed by means of annual country GNP deflators and the 1972 exchange rates. This method corrects each year's data as expressed in domestic currency for the impact of inflation within a country and expresses the result in 1972 dollars. The year 1972 is used as the base year for the constant values shown because the data for most countries are complete through that year. Ratios\* derived from the several absolute value series are expressed in constant dollars only.

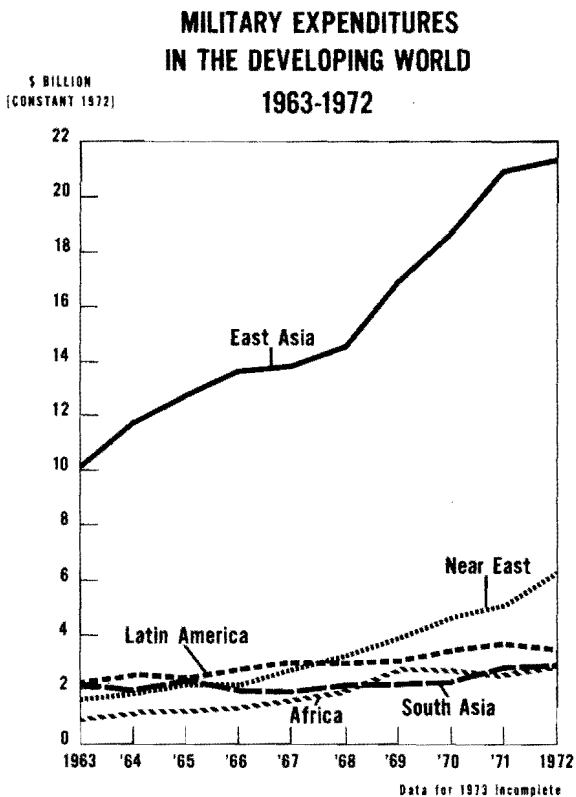

### Trends in World Military Expenditures

World military expenditures expressed in 1972 constant dollars\*\* were about \$197 bil-

\*As, for instance, military expenditures as a percentage of GNP, GNP per capita, etc.

\*\*All dollar totals appearing in the text are expressed in 1972 constant dollars. They are actually dollar equivalents derived from local currencies and corrected to the 1972 base year.

Chart II

lion in 1963 and are estimated at about \$241 billion for 1973. The growth of real world military expenditures has apparently *decelerated* in the seventies; the increase during the 1969-72 period was less than the increase during the 1963-66 period or the 1966-69 period.

Two tables of data are shown: Table I lists estimates of military expenditures, GNP, population, and armed forces by regions and groups of countries by year. Table II shows the same data by country by year. *Note: Because data for 1973 are incomplete for many countries, the 1973 totals in Table I are also incomplete, particularly for Africa and the Near East.*

As shown in the present survey of 136 countries, since 1963 the world has spent directly on military security the sum of more than \$2.5 trillion. Military spending retains a high priority in the budgets of most nations.

In considering the world totals over the years shown, the reader should recall that the figures reflect abnormal military expenditures

because of the conflicts in East Asia and the Near East. Also, because the time series end in 1973, the effects of the energy crisis and higher crude oil prices are not reflected in this period but will be isolated in future editions.

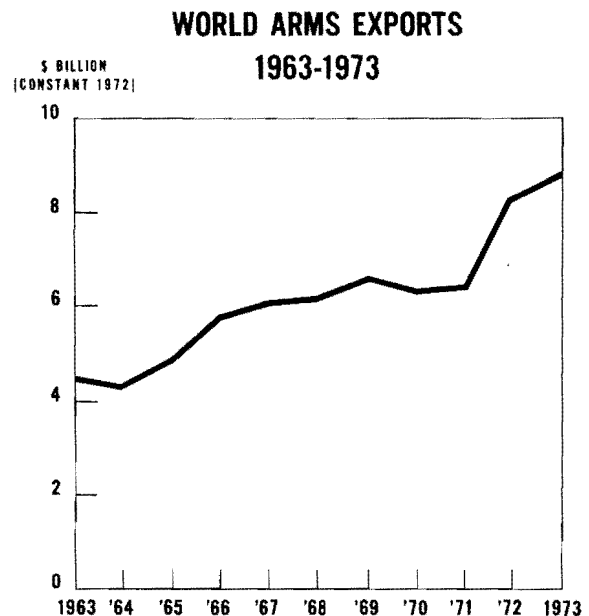

#### Developed and Developing Worlds

The share of the developing countries' GNP devoted to military expenditures is beginning to approach that of developed countries. Also, the growth rate for military expenditures and armed forces in developing nations was higher than the rate in developed nations. These increases are influenced, of course, by the conflicts in East Asia and the Near East and to some degree by the need felt by newly independent nations to establish their armed forces.

For the developing countries, estimated military expenditures generally understate the level of military programs, because the value of military assistance received in the form of grants is not included. Grant aid is not a spending burden on the recipient; instead, in this publication, it is counted in the military expenditures of donors, not recipients.

It would be incorrect to assume from the above that most developing countries are put-

Chart III

ting strains on their economies by military spending. Patterns of military expenditures vary widely throughout the developing world. In Latin America, South Asia, and Africa military expenditures have been relatively modest. For example, defense budgets in all of Latin America grew from \$1.9 billion in 1963 to an estimated \$3.3 billion in 1972. As a proportion of GNP, estimated annual military expenditures in the Latin American Republics have remained fairly stable at about 2 percent or less. Annual military expenditures per capita rose slightly from 1963 to 1972, from \$8.53 to \$11.25.

In contrast, East Asia and the Near East, continuing crisis areas during the period, exhibited less stability in military expenditures.

#### World Arms Trade

Three tables of arms trade data are presented. Table III shows estimated amounts imported by recipient countries, broken out by major sup-

pliers, for the cumulative 10-year period 1964-73. Note that in this table the estimates, which must be considered only very rough approximations, are given in current dollars. Table IV shows estimated arms imports and exports for groups and regions by year. Table V depicts estimated arms imports and exports by country, broken out by year, in both current dollars and in constant 1972 dollars. See the Statistical Notes and footnotes under each table for explanations of these rough approximations.

In 1963 the estimated value of worldwide arms exports was about \$4.4 billion. In 1973 the estimated value was about \$8.7 billion. (Both figures are in constant 1972 dollars.)

#### Relative Burden

Chart IV displays the countries in this survey according to two ratios: military expenditures as a proportion of GNP and per capita GNP.

Chart IV

RELATIVE BURDEN OF MILITARY EXPENDITURES, 1972

Military Expenditures as % of GNP	GNP Per Capita							
	Less than \$100	\$100-199	\$200-299	\$300-499	\$500-999	\$1,000-1,999	\$2,000-2,999	More than \$3,000
More than 10%	Cambodia Laos Vietnam, North	Vietnam, South Yemen, (Aden)	Egypt Jordan	Iran Iraq Syria	Saudia Arabia		Israel	United Arab Emirates

United States Arms Control and Disarmament Agency

## STATISTICAL NOTES

A major purpose of this report is to provide a comprehensive picture of the world's military expenditures, armed forces, and arms trade, detailed by country and region. The report also includes gross national product (GNP) and population.

Although the best of the readily available international and domestic sources were used, the reader should be aware that the reported data are not fully comparable and equally reliable. The national data from which the reported information is derived may differ in definition and accuracy. Conversion from national currencies into dollars can lead to important distortions in various time series, particularly in cases of rapid inflation or sharp changes in exchange rates. In order to achieve comprehensiveness, judgmental estimates were made in a few cases where data were unavailable or inadequate.

The 1973 data for many countries are not yet available. No attempt was made to estimate these gaps individually.

### COVERAGE AND AGGREGATION

#### Country Coverage

This report covers a total of 136 countries. Of the present U.N. membership of 135, the following countries are not listed in this report: the Byelorussian and Ukrainian Soviet Socialist Republics (considered constituent republics of the Soviet Union), the Bahamas, Barbados, Bhutan, Fiji, and the Maldives (small developing nations for which data are not generally available). Nine other small independent states, with a combined total 1973 population of 400,000, are also excluded.

Of those countries that are not members of the United Nations, eight were included in this report: Bangladesh, the Republic of China, the two Koreas, Switzerland, Southern Rhodesia, and the two Vietnams.

Of the reported countries, 18 have become

independent since 1963. Data for them are normally shown in the tables beginning with the first year in which they were independent for more than 6 months. In a few cases, arms trade data are shown for pre-independence years.

#### Groups and Regions

Country groupings and regions in this report are essentially geographical. It should be noted, however, that only the United States and Canada are represented in "North America," and that Mexico is included with Central and South America as "Latin America." Similarly, Egypt is assigned to the "Near East" with other Asian countries, rather than to "Africa." Total North Atlantic Treaty Organization (NATO) consists of the North American nations and those of European NATO.

In addition, the 13 nations which comprise the Organization of Petroleum Exporting Countries (OPEC) are displayed as a group. These are geographically disparate: Iran, Iraq, Kuwait, Qatar, Saudi Arabia, and the United Arab Emirates in the Near East; Indonesia in East Asia; Algeria, Gabon, Libya, and Nigeria in Africa; Ecuador and Venezuela in Latin America.

#### Developed and Developing Countries

Of the 136 countries covered in this report, 28 are classed as "developed" and 108 as "developing." The developed countries include all those in North America; in Oceania; in European NATO except Greece and Turkey; in the Warsaw Pact except Bulgaria; and also Austria, Finland, Ireland, Japan, South Africa, Sweden, and Switzerland. (A listing of the countries comprising each region or group can be found in Table III, where developed countries are denoted with an asterisk.)

The developing countries include all those in Latin America, in the Near East, in South Asia, in East Asia except Japan, in Africa

except South Africa, and also Albania, Bulgaria, Greece, Malta, Spain, Turkey, and Yugoslavia in Europe.

For the non-Communist countries, assignment to one or the other category follows the practice employed by the U.S. Agency for International Development (AID). For both non-Communist and Communist countries, assignment is primarily based on GNP per capita. Most of the countries classified as developing have a 1972 GNP per capita below \$1,500. Exceptions are Bulgaria, Libya, Israel, Qatar, Kuwait, and the United Arab Emirates. Conversely, below the \$1,500 level but classed as developed are the Republic of South Africa and Portugal. These exceptions are based on factors such as national literacy and mortality rates, levels of industrialization, and terms of trade (relative export and import prices) which override the simplistic GNP per capita criterion.

## **COMPUTATIONAL PROCEDURES**

### ***Values and Inflation***

Several options are available in presenting data concerning world military expenditures and arms trade. Trade levels may all be given in a common unit, e.g., dollars, or each may be shown in the currency of the nation involved. They may be listed in current prices (i.e., unique to each year) or in constant units. If the latter are used, a reference year must be chosen. Arms trade might also be reported in physical units: numbers of tanks, airplanes, or ships. Among these alternatives we have chosen to show the data for world arms trade in terms of both constant (1972) and current U.S. dollars.

A comparison of the arms trade of various countries by numbers of physical units can be useful for obtaining a rough measure of relative military capabilities. However, the variations in characteristics of systems produced by different countries may limit severely the validity of such comparisons. The variation in the military worth of particular types

of systems in various environments further complicates such comparisons.

For purposes of obtaining an approximate comparison of the economic value of the arms trade, a standard currency value, the U.S. dollar, is used as a common surrogate for armament acquisitions.

However, despite the use of a common unit, close comparisons of imports and exports with the other various series are unwarranted because of the inter-nation factors reflected in the arms trade data. The disparities among national economic systems generate differences in the extent to which weapons prices represent true production costs in different nations—the differences are particularly significant between Communist and non-Communist economies. Furthermore, much of the international arms trade involves barter arrangements, multiyear loans, discounted prices, and partial debt forgiveness, so that acquisition by some nation of a given quantity of armaments does not necessarily imply an equivalent burden on its economy.

Thus, the arms trade values shown are only best estimates of the U.S. dollar value of armaments shipped from each nation during a given year and should not be related in detail to the local economies. The quality of these estimates is difficult to assess because of the lack of detailed official data on arms trade activities outside the United States. The quality of these estimates is further impaired by the variations in international exchange rates during any given year and the difficulty of establishing any meaningful exchange rates at all between Eastern and Western nations.

Widespread inflation over the past decade introduces significant distortions into the essence of the arms trade data. The armaments procurable for a million U.S. dollars in 1964 cost considerably more dollars in 1973. Thus the reporting of annual purchases only in equivalent current dollars for each year would present an impression of inordinate growth in arms trade which seriously misrepresented the physical transfer of armaments among nations. Yet no simple compensation for in-

flation is entirely valid. Inflation rates vary among nations; in particular, they may differ between supplier and recipient for a given series of arms transfers. Furthermore, the inflation rate for a nation's economy as a whole is not necessarily representative of those economic sectors particularly involved in the production of armaments. In the United States, for example, the interindustry coefficients relating the electronics industry to other sectors have changed significantly during the last decade, while such electronic equipment as radars, missile guidance packages, and communications hardware have simultaneously claimed an increasing proportion of armament costs. Unfortunately, no basis exists for accurately reflecting inflation's impact on armament types, even if separate inflation rates for different economic sectors in different nations were available. Thus, the arms trade estimates shown herein inevitably are imprecise, having been influenced by error-inducing forces.

*In general, neither the magnitudes nor the directions of these individual contributions to error are known.* Overall inflation, however, clearly generates a very significant bias in representing the growth of physical arms trade in the world. To provide an approximate but consistent compensation, we have also shown the values in constant 1972 dollars, using the U.S. implicit GNP deflators as common deflators for all arms trade. This conceptual oversimplification is mitigated at least partially by the ease with which our calculations can be understood and duplicated, so that readers may perform their own alternative analyses if they so desire. Moreover, selection of the U.S. inflation rate as the common standard for the world during the last decade does not appear to be unreasonable. According to the data available to us, the overall U.S. inflation during this period (41 percent) was exceeded by slightly more than half of the other nations; the average among all nations without runaway inflation was approximately 46 percent.

Thus the U.S. experience is not atypical, and its use as an archetype for the rest of the world does not appear to introduce a dispro-

portionate degree of error compared with other sources.

Denoting the U.S. deflator for year  $i$  as  $D_i$  and that for the base year (1972 in this case) as  $D_b$ , the reported constant dollar value  $V_{ri}$  of arms trade for year  $i$  is related to the estimated current dollar value  $V_c$  by the expression  $V_{ri} = V_c (D_b/D_i)$ .

The specific deflators used for the U.S. economy are as follows:

1963 = 107.17	1969 = 128.20
1964 = 108.85	1970 = 135.24
1965 = 110.86	1971 = 141.35
1966 = 113.94	1972 = 146.12
1967 = 117.59	1973 = 153.94
1968 = 122.30	

#### Conversion Rates

For most countries, the official exchange rate prevailing in each year is used to convert the values of military expenditures and GNP from national currencies into U.S. current dollars. Official rates are used, despite their drawbacks, since suitable alternatives are not readily available in most cases.

Most rates used were the "general purpose conversion factors" shown in the IMF's monthly, *International Financial Statistics*. For most countries the rate to 1971 was the official parity or central rate, and subsequent rates were period averages to the spot market rate.

Where no IMF par value or central rate is in force, some other available rate was selected.

It is recognized that official exchange rates are not an ideal means for converting national currencies into a common denominator. Official rates, even if they originally reflected relative foreign trade prices accurately, do not reflect relative internal prices. Once fixed, they are too often inflexible with respect to price changes over time, and occasional devaluations produce such large changes that trends are distorted.

Ideally, to sum up and compare the GNP and military and other public expenditures of various countries, outlays in the respective

currencies should be converted to a common currency by use of parities that reflect the internal purchasing power of each currency for all goods and services making up GNP. These parities should differ for each component sector of GNP, since the appropriate parity depends on the particular mix of goods and services involved. Purchasing power parities of this type are, however, difficult to estimate and are available only for a relatively few countries.

In several cases where the official rates appeared to produce large distortions, or where there are no official rates, alternative rates have been used. These cases include the Soviet Union and most other Communist nations, as well as several countries in Latin America and Asia.

For the Soviet Union and other Warsaw Pact countries, the basic sources of data on GNP (in dollars) use estimated purchasing power parities for conversions. In the Soviet estimates, the parities used for GNP and for military and other public expenditures are derived by different methods of calculation.

Conversion rates for India, Indonesia, and Yugoslavia are roughly estimated by selecting the years for which available rates appear to be most valid and by then adjusting these rates for other years in accordance with relative U.S. and domestic currency price movements.

### Prices

To correct the effects of inflation on military spending and GNP, current price data were converted to constant 1972 prices by use of GNP deflator indexes for each country from the socioeconomic data bank of the International Bank for Reconstruction and Development (World Bank). Some deflators were also obtained from the AID publication, *Gross National Product—Growth Rates and Trend Data*, May 1, 1974. The U.S. GNP deflator was obtained from the *Economic Report of the President*, Washington, January 1974 and Department of Commerce *Survey of Current Business*, July 1974.

World Bank deflators for Bangladesh and Pakistan, provided separately for the entire period 1961–73, were recombined (using GNP as weights) for the period through 1971 prior to Bangladesh independence.

For the Communist countries (except Cuba) and Yemen (San'a), price adjustment to 1972 dollars was done by means of the price deflators applicable to the U.S. GNP, since the conversion to dollars for these countries was made at rates approximating annual purchasing power parities.

### Growth Rates

It has become customary to compute rates of compound growth for GNPs by fitting straight lines to the logarithms of time-series by the method of least-squares. Let  $x_i$  be the value of the time series at  $t_i$ . The procedure is to determine  $C$  and  $K$  that minimize

$$\sum_i (\log x_i - Kt_i - C)^2.$$

This computationally convenient procedure involves a theoretical error which is of negligible consequence in the situations to which it is usually applied—where the resulting exponential curve provides an excellent “fit” for the data and the time series varies “slowly” so that  $Kt_i$  is not too far from zero. Because of the convenience of the method, and because of its traditional use, it has been adopted here for the computation of compound growth rates for the world military expenditures. The conditions for its application with only negligible error are evidently met in this instance.

When we turn to consideration of the arms transfers of individual nations, however, these conditions are not met and applying this standard procedure would produce very misleading results. Because the logarithms of very small numbers are large negative numbers, it is apparent that this standard method weights small values much more heavily than large values, so that the small values dominate the estimate. When zero values occur in the time-series the method fails completely, and the computations are not even possible. The method also fails to have reasonable time-

averaging properties for rapidly varying data. If a procurement cycle dictates periodic large purchases with very small purchases in the intervening years, the small purchases will dominate the estimate and a compound growth rate, which may be present in the large purchases, will be neglected. For these reasons it is not appropriate to apply the standard technique to national arms transfers.

The use of compound growth rates in itself implies a causal mechanism whereby the magnitude of the time-series influences its growth rate. Where such underlying causal factors are evident, as in populations, a more justifiable method for estimating compound growth rates is to choose  $C$  and  $K$  to minimize

$$\sum_i x_i [x_i - \exp(C + Kt_i)]^2.$$

The introduction of the factor  $x_i$  to weight the near-square error accounts for the fact that each individual of the population, for instance, must be counted at each observation rather than all of the individuals being lumped into a sample of varying size. This method requires a much more complicated numerical procedure than the standard one. A compromise technique can be produced by weighting the error terms of the standard technique by  $x_i$ . All of the arguments, however, presume a particular type of basic causality underlying compound growth rates. It is not apparent that such a causal mechanism can be assumed to be operating in national arms transfers.

Absolute rates of growth may be of interest, despite the absence of an explanatory causal theory. These are produced by fitting a straight line to the time-series itself, rather than to its logarithm. This procedure has desirable time-averaging properties, and it is computationally convenient. The fact that the resulting straight lines may indicate negative values outside the period for which the data are given may have the salutary effect of inhibiting unwarranted extrapolation into the far future. We have, therefore, adopted this technique for dealing with national arms transfers.

The data for various nations differ greatly, however, in the degree to which they suggest a consistent pattern of growth; indeed, some samples might give the impression of having been generated by a random process. The co-

efficient of correlation is widely used to indicate the extent to which a data sample confirms a linear relationship between two variables. Thus, in addition to presenting the absolute (i.e., linear) growth rate manifested by the arms trade data for each nation, we have also shown the associated correlation coefficient. It should be noted that although widely dispersed data will result in a low correlation coefficient, the converse is not necessarily true. Technically, the coefficient measures the extent to which the hypothesized linear relationship (in our case, the calculated absolute growth rate) is superior to the mean as a representation of the data sample. A zero growth rate will have a zero coefficient of correlation by definition, and thus a shallow growth rate can have a low coefficient even if the data dispersion is small. Similarly, a cyclical data relationship will be poorly represented by either the mean or any linear expression and will thus have a low coefficient even if the cyclical pattern is quite distinct. In summary, the presence of a low correlation coefficient should not be taken automatically as an indicator that the arms trade data in question do not follow any time-related pattern, but only as a determination that no linear representation was found to be significantly better than the mean as a predictor of the sample data values.

#### **Estimate of Soviet Military Expenditures:**

##### **Sample Calculation for 1972**

(In Billion Current Dollars)

Initial Data (apply to 1972 unless otherwise indicated)

- (1) Official Soviet "Defense" budget—actual expenditures (bil. Rubles) .....17.9
- (2) Total Soviet expenditures on "Science," budgetary and other (bil. R) .....14.4
- (3) Estimated number of persons in Soviet Armed Forces (mils.) .....3.51
- (4) Estimated average Soviet military personnel costs in 1955 (R per man) ....786
- (5) Index of average annual compensation of workers and employees in the Soviet economy (1955 = 100) .....180.9
- (6) Total U.S. military compensation outlays (bil. \$) .....22,675

- (7) Average annual number of persons in U.S. Armed Forces (mils.) .....<sup>a</sup> 2.45  
 (8) Estimated conversion rate for non-personnel military outlays (\$/R) .....<sup>b</sup> 2.44

Computations (apply to 1972)

- (9) Total Soviet military expenditures (bil. R): (1) +  $\frac{1}{2}$  of (2) [17.9 + 7.2] ... 25.1  
 (10) Average Soviet military personnel costs (R per man): (4)  $\times$  (5) [786  $\times$  1.809] ..... 1,422  
 (11) Total Soviet military personnel outlays (bil. R): (3)  $\times$  (10) [3.51  $\times$  1,422] .4.99  
 (12) Average U.S. military personnel costs (\$ per man): (6)  $\div$  (7) [22,675  $\div$  2.45] ..... 9,259  
 (13) Estimated conversion rate for military personnel outlays (\$/R): (12)  $\div$  (10) [9,259  $\div$  1,422] ..... 6.5  
 (14) Dollar equivalent of Soviet military personnel outlays (bil. \$): (11)  $\times$  (13) [4.99  $\times$  6.5] ..... 32.4  
 (15) Total Soviet military nonpersonnel outlays (bil. R): (9) - (11) [25.1 - 4.99] ..... 20.1  
 (16) Dollar equivalent of Soviet military nonpersonnel outlays (bil. \$): (8)  $\times$  (15) [2.44  $\times$  20.1] ..... 49.0  
 (17) Dollar equivalent of total Soviet military expenditures (bil. \$): (14) + (16) [32.4 + 49.0] ..... 81

## DEFINITIONS AND SOURCES

### Population

Population estimates are for midyear and are supplied by the International Statistical Program Center, Bureau of the Census, U.S. Department of Commerce. Data on the People's Republic of China are midyear estimates prepared by the Foreign Demographic Analysis Division, Bureau of Economic Analysis, U.S. Department of Commerce.

<sup>a</sup> This is an annual average figure. It is considered more appropriate for comparison with total annual compensation expenditures than the mid-year level shown in Table II.

<sup>b</sup> This rate, initially calculated by others for producers' durables, is applied by Bergson to "munitions" purchases. It is here applied to all nonpersonnel outlays despite the fact that the rate used by Bergson for other goods purchased for defense purposes (\$1.12 per ruble) is lower, since the rate for military R&D is probably higher—although not estimated by Bergson, other estimates range from \$2.50 to \$4.50.

NOTE: There is a lack of information on the movement of Soviet military hardware prices since 1955. However, considerable evidence indicates that Soviet machinery and equipment prices have actually risen despite the fact that the official price index for that industry shows a price decline. (See Abraham S. Becker, *Ruble Price Levels and Dollar-Ruble Ratios of Soviet Machinery in the 1960s*. RAND R-1063-DDRE. January 1973.) Becker (p. 21) roughly approximates the rise in average Soviet machinery prices between 1958 and 1970 at 25 percent. This matches the rise in the U.S. wholesale price index for the same period. Although Becker (p. 22) speculates that Soviet military machinery may be less subject to price inflation than civilian, he suspects that inflationary mechanisms operate in common on both. It is therefore considered that a constant conversion rate, implying parallel movement of U.S. and Soviet prices over time, is the best simple assumption to make on the basis of the scanty evidence.

## **Armed Forces**

Armed forces refer to active-duty military personnel, including paramilitary forces where those forces resemble regular units in their organization, equipment, training, or mission. Reserve forces are not included unless specifically noted.

Figures for the United States represent midyear totals and are from the U.S. Department of Defense, Office of the Assistant Secretary of Defense (Comptroller), *Active Duty Military Personnel by Selected Periods*, August 31, 1973. Estimates of the number of men under arms for other countries were also provided by U.S. Government sources.

## **Gross National Product (GNP)**

The reported GNP represents the total output of goods and services produced by residents of a country and valued at market prices ultimately paid by the consumer.

Sources of GNP for non-Communist countries were primarily the economic data banks of the World Bank and AID. For some of the earlier years data were obtained from AID statistical files and the previous edition of this publication, *World Military Expenditures 1971*.

GNP data for 1973 in some countries were available in constant dollars only. Those figures were obtained by applying rates of increase (supplied by the World Bank) to 1972 GNP in constant dollars. For those countries, therefore, GNP data in current dollars were not always available.

Data for Bangladesh and Pakistan are separated in the sources cited above. For this report, the data for both countries are combined in the Pakistani totals through 1971, when Bangladesh achieved independence. For 1972 and 1973, the data are shown separately.

Soviet GNP data are estimates reported in a statement by CIA Director William E. Colby before the Subcommittee on Priorities and Economy in Government of the Joint Economic Committee (JEC) of Congress, *Allocation of Resources in the Soviet Union and China*, April 12, 1974, p. 49.

The GNP data for other Warsaw Pact countries are those estimated by Thad P. Alton in the JEC compendium on the economies of Eastern Europe cited below.

It should be noted that the estimates of Soviet GNP are expressed in a dollar equivalent that is derived from valuations of Soviet and U.S. GNP in both rubles and dollars, which results in an exchange rate different from the rates used in estimating Soviet military expenditures. The estimates of Soviet military expenditures, on the other hand, reflect dollar prices only and portray the cost of duplicating the Soviet military effort in the United States. Although use of these diverse types of dollar equivalents for the respective aggregates has become customary in Western literature for purposes of intercountry and nonpersonnel comparisons, it should be emphasized that estimates of GNP and military expenditures derived in this manner are not comparable with each other. (See also Relative Burden, below.)

The GNP estimates for the other Warsaw Pact countries, although estimated in an indirect manner, reflect the same type of hybrid dollar equivalent valuation as used for Soviet GNP. For these countries also, military expenditures are not converted by the same method as GNP is converted.

GNP estimates for the People's Republic of China are derived and updated from data in another JEC compendium: Arthur G. Ashbrook, Jr., "China: Economic Policy and Economic Results, 1949-71," in *People's Republic of China: An Economic Assessment* (Washington: GPO, 1972). Estimates for Albania, Cuba, Mongolia, North Korea, North Vietnam, and Yugoslavia are rough approximations.

*Cautionary note: Intercountry comparisons of military expenditures, GNP, and GNP per capita are suspect because of disparities in the purchasing power of the dollar equivalents shown.*

## **Military Expenditures**

An effort was made to apply a standard concept of military expenditures. They are defined to include current and capital expendi-

tures to meet the needs of the armed forces; expenditures of national defense agencies for military programs; expenditures for the military components of such mixed activities as atomic energy, space, and research and development; military assistance to foreign countries; military stockpiling; retirement pensions of career personnel; and expenditures on certain paramilitary forces as defined above. Excluded are expenditures for veterans benefits, civil defense, civilian space, strategic industrial stockpiling, and public debt service.

The principal source of data for developing countries was AID, which compiles figures on military expenditures for most non-Communist countries, although not precisely according to the standard definition given above.

Data on NATO countries were obtained from NATO publications (Press Release, *Defense Expenditures of NATO Countries, 1949-1973*, December 7, 1973, and *NATO Facts and Figures*, October 1971). Most of the information for non-NATO European countries was from the Organization for Economic Cooperation and Development (OECD) publication, *National Accounts of OECD Countries 1960-1971* (1973).

Information from the series *The Military Balance*, published by the International Institute of Strategic Studies, and from *The Statesman's Yearbook* (London: Macmillan, 1972-1973 edition) was used for some years for several non-Communist countries where AID information was not available. Also used were the *United Nations Statistical Yearbook*, the 1972 U.N. report, *Economic and Social Consequences of the Arms Race and of Military Expenditures*, and the predecessor to this document, *World Military Expenditures 1971*. (Data for the Republic of China, for example, came from such unofficial sources.)

Estimates of Soviet military spending in U.S. dollars were adapted from national data and various estimates made by Western analysts. It is generally agreed that announced Soviet defense budgets omit some expenditure categories in the standard definition, particularly military research and development and military space outlays. Other likely exclusions are military assistance, nuclear programs, and

paramilitary internal security forces. Published Soviet data do not provide a basis for estimating such exclusions accurately in detail.

ACDA made a rough allowance for all such omissions by adding to the announced Soviet defense budget one-half of reported ruble outlays in "science," which are believed to include military research and development and military space outlays. Civilian space activities are assumed to be excluded, and no further adjustment is made, as had been done in previous estimates. Conversion to dollars is developed separately for personnel and non-personnel outlays using estimated ruble/dollar ratios designed to show what Soviet defense purchases would cost at U.S. prices. A sample calculation is shown above in the section on computational procedures.

Estimates for other Warsaw Pact countries are taken from Thad P. Alton *et al.*, "Military Expenditures in Eastern Europe: Some Alternative Estimates," in the JEC of Congress compendium, *Reorientation and Commercial Relations of the Economies of Eastern Europe*, July 1974. As in the case of the Soviet Union, these estimates are intended to show what the national defense purchases would cost at U.S. prices, with estimated personnel and nonpersonnel outlays being converted at separate rates intended to approximate purchasing power parities.

For the People's Republic of China, very rough estimates are derived from fragmentary information. No budgetary data have been issued by China since 1960.

#### **Arms Trade**

Arms trade represents the international transfer under grant, credit, or commercial sales terms of military equipment usually referred to as conventional, including weapons of war, parts thereof, ammunition, support equipment, and other commodities considered primarily military in nature. Among the items included are tactical guided missiles and rockets, military aircraft, naval vessels, armored and nonarmored military vehicles, military communications and electronic equipment, artillery, infantry weapons, small arms,

ammunition and other ordnance, parachutes, and uniforms. Excluded by definition are nuclear, chemical, and biological weapons and strategic missile systems. Also excluded are foodstuffs, medical equipment, and other items potentially useful to the military but with alternative civilian uses. The trade statistics cover the actual movement of goods during the referenced year and do not include the value of programs, agreements, contracts, or orders which may result in a future transfer of goods. The data represent arms trade between governments and do not include data on arms to insurgents and terrorist groups.

### **Relative Burden**

The relative burden of military spending is commonly measured by its proportion to total GNP. This measure is shown in Tables I and II and in Chart IV, juxtaposed with each country's per capita GNP, a factor which the reader may wish to take into account in gauging the significance of the ratio.

As differences in the relative wealth of countries become wider, the ratio to GNP becomes less valid for intercountry comparisons. Poorer countries tend to devote a larger share of their income to consumption. At the same time, they have a more urgent need for rapid economic growth, which requires resources for investment. In these countries, therefore, any diversion of resources to military programs represents heavier burdens than it does in the wealthier countries. At the same time, technical training of military personnel contributes to the civilian labor forces and to development of the poorer countries.

As a measure of economic burden within a country, the ratio of military expenditures to

GNP should preferably reflect the prices of the country concerned. Since for most countries military expenditures and GNP are converted from national currencies into dollars at the same rate, the proportion between the two is the same as that which would obtain in national currency terms.

In the case of the Soviet Union, however, this ratio cannot be derived directly from the dollar estimates given in the tables because of differences in the methods of converting Soviet military expenditures and GNP into dollar equivalents. When both Soviet Union military expenditures and GNP are valued in rubles at adjusted factor cost, it is roughly estimated that the relative burden ratio would fall within the range of 6–10 percent.

Estimates of GNP and military expenditures in dollars for other Warsaw Pact countries are derived in roughly analogous fashion to those for the Soviet Union. Consequently, the ratio of military expenditure to GNP implied in the data shown here would be different from the ratio if computed in domestic currencies. Ratios for these countries, obtained when both measures are expressed in domestic currencies and reflect prevailing prices, are considerably lower, as shown by Alton *et al.*, "Military Expenditures in Eastern Europe: Some Alternative Estimates," cited previously. However, such ratios are considered by Alton to be misleading due to the relative underpricing of enlisted servicemen and other military purchases. In the absence of estimates of military spending in these countries at adjusted domestic currency prices reflecting factor costs, a meaningful ratio to GNP cannot be obtained. The actual ratio of military expenditures to GNP for all non-Soviet Warsaw Pact countries combined probably was in the vicinity of 5 percent during the period.

a/ Converted from domestic currencies into dollars at rates prevailing in or estimated for each year. See Statistical Notes, Conversion Rates.

b/ Values in "constant dollars" are obtained by deflating country data in current domestic prices to 1972 prices and converting to dollars at 1972 conversion rates.

c/ The growth rates in this table:

- (i) are compound rates obtained by a least-squares fit of a straight trend line to the logarithms of the values;
- (ii) apply to 1963-72 only—1973 is excluded due to the nonavailability of data for a number of countries (denoted by N. A. in Table II);

(iii) are not calculated for current-dollar series because of the distorting effects of inflation and changes in exchange rates.

(iv) are somewhat distorted for some groupings, particularly Africa, due to the inclusion of new countries as they become independent throughout the period.

(See Statistical Notes for further discussion of growth rates.)

d/ Military expenditures and GNP as calculated are not fully comparable due to the use of different types of dollar conversion rates for the two variables. On a comparable basis, the estimated range given is a more valid measure. See Statistical Notes, Relative Burden.

TABLE II. MILITARY EXPENDITURES, GNP, POPULATION, AND ARMED FORCES  
BY COUNTRY BY YEAR

COUNTRY OR REGION	YEAR	MILITARY EXPENDITURES (MILEX)		GROSS NATIONAL PRODUCT (GNP)		MILEX GNP (%)	PEOPLE (millions)	MILEX per capita (constant dollars)	GNP per capita (constant dollars)	ARMED FORCES (thousands)	MILEX ARMED FORCES (constant dollars)	ARMED FORCES per 1000 people
		Current dollars (millions)	Constant dollars (millions)	Current dollars (millions)	Constant dollars (millions)

— None or negligible.

... Pre-independence years—data for which are not shown except for arms imports in a few cases.

N.A. Data not available.

a/ Paramilitary forces are not included.

b/ Military expenditures and GNP as calculated are not fully comparable due to the use of different types of dollar conversion rates for the two variables. On a comparable basis, the estimated range given is a more valid measure. See Statistical Notes, Relative Burden.

c/ Paramilitary forces are included for 1970-73. (For Burma, 1969-73.)

d/ Estimated by extrapolation from 1965 on the assumption that the annual rate of increase in 1964 and 1965 was the same as the average level of 1966-71 (6%).

e/ Constant-price values for 1963 and 1964 employ a GNP deflator index derived from current-price GNP as described in footnote (d) and constant-price GNP data from World Bank sources.

f/ Constant price values for 1963-64 employ a GNP deflator index estimated from the Cameroon consumer price index.

g/ Estimated by applying the ratio of military expenditures to GNP obtaining in the latest available previous year to GNP in the given year.

h/ GNP in current prices and the GNP deflator index are estimated from constant-price GNP and price index data in World Bank sources.

TABLE II. MILITARY EXPENDITURES, GNP, POPULATION, AND ARMED FORCES  
BY COUNTRY BY YEAR--Continued

J/ Estimated to have remained in 1970-72 at the same level as the annual average for 1966-69.

J/ Estimated as equal to the previous year.

K/ The figures for the years 1963 and 1964 represent only the Army of the Republic of Cyprus. Figures for other years include, in addition, the Greek Cypriot National Guard and the Greek Cypriot police; the Turkish Cypriot police are also included for the years 1966-71.

L/ Estimated by interpolation.

M/ Militia is included for 1972 and 1973.

N/ Civil Militia is included for 1963-73.

O/ Constabulary force is included for 1971-73.

P/ Police are included for 1964-73.

Q/ Paramilitary elements of the National Security Force are included for 1968 and 1969.

R/ POW's held in India are excluded in 1972.

S/ Police are included for 1963-70.

T/ Estimated by extrapolation from the next year, on the assumption that the annual rate of increase was the same as that in the succeeding year.

U/ The figure for 1973 represents police mobile forces only.

V/ Data cover Tanganyika only (excluding Zanzibar) for GNP in all years and armed forces in 1963 and 1964.

W/ Estimated as a share of the expenditures for defense, justice, and police on the basis of the defense share in 1969 (23%).

X/ The national police force is included for 1971-73.

Y/ The national gendarmerie is included for 1973.

\* Developed countries.

\*\* Organization of Petroleum Exporting Countries (OPEC).

†Data for U.S.A. are by fiscal year. Includes materiel shipped under the grant Military Assistance Program, Foreign Military Sales program, commercial sales, the cost of FMS training, supply and services costs, plus materiel delivered under the Excess Defense Articles program and ship loans. Also includes costs under the Military Assistance Service funded programs to countries in Southeast Asia. Since the data are by fiscal year, the total does not include the resupply effort to Israel following the October 1973 war.
